Measures of Compactness Summary

| | |
|-------------------------------|--|
| Reock | The measure is always between 0 and 1, with 1 being the most compact. |
| Schwartzberg | The measure is usually greater than or equal to 1, with 1 being the most compact. |
| Alternate Schwartzberg | This measure is always greater than or equal to 1, with 1 being the most compact. |
| Polsby-Popper | The measure is always between 0 and 1, with 1 being the most compact. |
| Population Polygon | The measure is always between 0 and 1, with 1 being the most compact. |
| Area / Convex Hull | The measure is always between 0 and 1, with 1 being the most compact. |
| Population Circle | The measure is always between 0 and 1, with 1 being the most compact. |
| Ehrenburg | The measure is always between 0 and 1, with 1 being the most compact. |
| Perimeter | The Perimeter test computes one number for the whole plan. If you are comparing several plans, the plan with the smallest total perimeter is the most compact. |
| Length-Width | A lower number indicates better length-width compactness. |
| Cut Edges | A smaller number implies a more compact plan. The measure should only be used to compare plans defined on the same base layer. |
